DETAILED ACTION

Double Patenting

1. A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain a patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

2. Claims 1-20 are provisionally rejected under 35 U.S.C. 101 as claiming the same invention as that of claims 1-20 of copending Application No. 10/709,519. This is a provisional double patenting rejection since the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

4. Claims 1 and 2 are rejected under 35 U.S.C. 102(a) as being anticipated by Natsume et al (2004/0100240).

Natsume et al discloses an integrated circuit power supply for providing a direct current (DC) source voltage, comprising: a source voltage supply unit (T1, T2) to supply said DC source voltage; a power supply control device (12) coupled to the source voltage supply unit; an output capacitor (C1) coupled to an output node of the integrated circuit power supply and a ground

terminal; and an output voltage coil (L1) coupled to the power supply control device (12) and to the source voltage supply unit (T1, T2) at a first terminal and to the output capacitor (C1) and the integrated circuit power supply output node at a second terminal (see figure 5).
